

## **Use of Calculators in Instruction (E-6)**

Technology can be a highly effective classroom tool for concept development, for practice of skills and concepts, for application of those skills and concepts, and for the development of problem-solving strategies. As one such technology, calculators should be used to develop concepts as well as eliminate tedious computation. With the use of calculators, students can solve problems before they have mastered computation skills, use realistic numbers in problems, and communicate with a machine in a very precise fashion.
